ОПЫТ

'Fake Posts'

- React, Axios, Vite, CSS modules
- This web app displays posts, using data from an API (JSONPlaceholder). The functionality includes sorting, searching, filtering, deleting the posts and creating new ones. The project is based on fundamental React concepts such as JSX, state, props, functional components, hooks, component lifecycle, routing, etc.

'BerryShop'

- React, TypeScript, Vite, Bootstrap
- This is a small online-store with a shopping cart. You can add, increment, decrement and delete items in the cart. The project has an advanced file structure and has been implemented with TypeScript. The main feature is the separate context for the cart, so that it's accessible from any page.

'Employees'

- React, Vite, Axios, Zustand, Tailwind
- A web app that renders a main page with the list of all company's employees, search bar, department tabs & a separate page for each employee. Data is received from an API. Functionality: displaying loading state and different error screens, switching between tabs to filter employees by department, searching by name or tag, backwards navigation from a profile page.
